How do you connect a power transformer to a backup load panel?

Connect one wire to the neutral bus in the backup load panel via an OCPD such as an inline fuse. Connect one wire of the secondary of the control transformer to one of the terminals of either NO/NC auxiliary contact from I/O-1 or I/O-2 on Enpower. Connect the other terminal of the auxiliary

How do you connect a transformer to an enclosure?

Connect the transformer primary according to the wiring diagram on the nameplate. Ground the enclosure in accordance with NEC and local electrical codes. Energize the unit and check the secondary voltage to ensure it is proper for the load. Select appropriate location to meet applicable codes, cable installation and mounting hardware. 13.

How do you install a power transformer?

Use flexible conduit coupling between the transformer and the wiring system. Install transformer as far away as possible from any area where sound is objectionable. Ventilated style power transformers are 600 Volt Class units with ventilated enclosures for natural draft cooling.

Who should install a transformer?

Installation, operation and maintenance of transformers should be performed by authorized personnel, trained and qualified in the installation, repair and maintenance of electrical equipment. As any other electrical equipment, transformers must be installed according to the requirements of all applicable national and local electrical codes.

How should a transformer be stored?

Transformers should be stored in a dry location of uniform temperature in their original packing. If storage of an unpacked transformer is to continue for an extended length of time, all ventilating openings should be covered to keep out dust.

Can a transformer be mounted above a heat generating equipment?

Transformers must never be mounted next to or above heat generating equipment. Ventilated core and coil assemblies are solidly grounded to the enclosure. On units equipped with electrostatic shields, the shields are grounded to the core. Encapsulated units have a ground stud located in the wiring compartment.
