What is fine line screen printing for solar cell metallization?

Fine line screen printing for solar cell metallization is one of the most critical steps in the entire production chain of solar cells, facing the challenge of providing a conductive grid with a minimum amount of resource consumption at an ever increasing demand for higher production speeds.

Can flatbed screen printing be used for metallization of solar cells?

Sebastian Tepner and Andreas Lorenz contributed equally to this work. This paper presents a comprehensive overview on printing technologies for metallization of solar cells. Throughout the last 30 years, flatbed screen printing has established itself as the predominant metallization process for the mass production of silicon solar cells.

How much silver is used in screen printed silicon solar cells?

For example, the amount of silver used in screen printed silicon solar cells has been reduced from 300 to 100 mg [8,28]. The share of plating technology is anticipated to increase to about 5%. The market share of stencil printing is expected to grow by 7% in the next decade.

Can a stencil printing process improve a conventional screen printing technique?

In this study conducted by ISFH, a stencil printing process was implemented to evaluate possible improvements versus the conventional screen printing approach. Analysis revealed that the screen printing technique tends to produce solar cell fingers that have a wave-like shape along the finger direction.

Are solar cells the future of printing?

As solar cells become mainstream energy sources, more stringent requirements will be expected from the printing technologies such as materials availability, supply chain management, environmental impact, regulations, and societal needs.

Are screen-printed solar cells better than silicon solar cells?

The screen-printed PSCs with a porous structure can offer improved resistance to adverse environmental factors such as humidity, heat, and UV rays, achieving long-term light stability for thousands of hours. However, it is still difficult to compete with current silicon solar cells.
