What are the characteristics of a solar roof?

There are several roof characteristics that effect how much your solar panels will produce. Here is the top six: Also known as azimuth,orientation is the direction your roof faces. For North American solar systems,the best roof design for solar panels is one with a large,unshaded south face (an azimuth of 180 degrees).

How do roof mounted PV solar panels work?

Roof mounted PV Solar Panels are typically supported by racking systemswhich come in two basic forms. The first is a mechanically fastened system and the second,the more common of the two,is a ballast restrained system. The mechanically fastened system penetrates through the roofing membrane and can be used in pitched roofs and flat roofs.

How many solar panels can be installed on a roof?

Along with orientation,the size of your roof will determine how many solar panels you can install. The average US home solar system size is 5 kilowatts or 12-13 panelswith a rating of 400 Watts.

How to design a PV panel roof?

DC cable routes have been identified and documented. The aesthetic impact of the PV Panel layout on the roof needs to be considered as part of the design. A symmetrical configuration will have a more pleasing appearance 12. Where possible, conduit and cable runs should be concealed.

How do you mount a solar PV system on a flat roof?

A flat roof is an ideal candidate for a ballasted (weighted) mounting system,whereby the solar PV system is simply affixed in place using concrete blocks. For roofs with greater pitch,the system will need to be held in place with mechanical anchors that attach to the structural system below.

What is a good roof angle for solar panels?

In the Northern Hemisphere,a south-facing roof pitched between 30 and 45 degreesis considered ideal for solar panels. Your roof should be in good condition and able to support the additional weight. You should also identify obstructions,such as nearby trees or buildings,that could cast shadows on your panels.
