What is a photovoltaic power station?

A photovoltaic power station, also known as a solar park, solar farm, or solar power plant, is a large-scale grid-connected photovoltaic power system (PV system) designed for the supply of merchant power.

What is a photovoltaic plant?

A photovoltaic plant is made up of PV modules and an inverter. Photovoltaic panels are responsible for transforming solar radiation. In turn, the inverter converts direct current into alternating current with characteristics similar to the electrical grid. A solar array is a collection of multiple solar panels that generate electricity as a system.

How to choose suitable locations for photovoltaic (P V) plants?

The selection of the most suitable locations for photovoltaic (P V) plants is a prior aim for the sector companies. Geographic information system (G I S) is a framework used for analysing the possibility of P V plants installation. With G I S tools the potential of solar power and the suitable locations for P V plants can be estimated.

What is a photovoltaic system?

The acronym PV is commonly used to refer to photovoltaics. A photovoltaic plant is made up of PV modules and an inverter. Photovoltaic panels are responsible for transforming solar radiation. In turn, the inverter converts direct current into alternating current with characteristics similar to the electrical grid.

When does a solar power station need a storage system?

The storage system is assumed to be integrated with the solar power station and will be replaced once in the middle of the operational lifespan of the power station.

Do solar power stations need subsidies?

The bus-bar prices of solar PV are generally compared with the on-grid electricity tariffs for coal power, a benchmark price at which coal-fired plants sell electricity to the grid companies, to determine whether solar power stations need subsidies (39) (reference SI Appendix, Fig. S3 for the local coal power tariffs distribution).
