

How does reduced shunt resistance affect a solar photovoltaic module?

Reduced shunt resistance (R s h) in solar photovoltaic cells can lead to module degradation and failure. An experimental method has been developed to simulate progressive degradation by artificially lowering the shunt resistance. A linear model has been developed which relates reduced R s h to module open-circuit voltage and maximum power output.

How to distinguish between shunt resistance degradation and other PV failure mechanisms?

However, to distinguish between shunt resistance degradation and other PV failure mechanisms the reduction in maximum power should be matched by a decrease in the fill factor and open-circuit voltage. The reduction in open-circuit voltage was small until the shunt resistance fell below 100 O cm 2. 4.3.

Can a shunt model avert a solar module failure?

The simplicity of the model allows it to be implemented in an online monitoring system to avert module failure. It has been shown that a reduction in the shunt resistance can lead to solar module degradation over time, resulting ultimately in module failure.

Can linear models predict shunt resistance degradation?

Linear models were developed relating reduction in shunt resistance to the solar cell's P m a x and V O C. These relationships are proposed as strong predictors and observers of shunt resistance degradation and are suitable for implementation in online monitoring systems for operational PV modules. 1. Introduction

What is the shunt resistance of a solar cell?

The area of the solar cell is 1 cm 2, the cell series resistance is zero, temperature is 300 K, and I 0 is 1 x 10 -12 A/cm 2. Click on the graph for numerical data. An estimate for the value of the shunt resistance of a solar cell can be determined from the slope of the IV curve near the short-circuit current point.

What is shunt resistance?

The shunt resistance is the parallel resistance across the cell's p - n junction; a bigger shunt resistance results in fewer photogenerated currents flowing through alternate paths (Ramalingam et al.,2017).

Shading can cause a signifcant loss in power for PV systems, though bypass diodes are built into the module output wiring to direct current around the module should a string be shaded.
